HOW TO PREPARE SPECIMEN FOR PROCESSING IN THE LYMPH NODE LOCATOR

Omnia Inventa Medical

1. *Separate all of adipose tissue from the segment of intestine.*
2. *While the specimen is intact, make multiple superficial incisions every 0.5-1.0 cm on both sides of the fat (this is to increase penetration of fat solvent into the specimen)*
3. *Cut the fat into long strips about 0.5 cm wide (no more than 1 cm wide).*
4. *Put the long strips into a large volume of solvent (Carnoy's, acetone, 95% alcohol). The long strips produce a more cohesive post compression block than multiple small pieces*
5. *If possible leave in fat solvent overnight (or at least 6 hours). Prior fixation in formalin is not necessary*
